

Healthcare Security Datasheet

Interim CISO Service

Our Chief Information Security Officer service provides interim security program leadership when your organization needs it most. Due to the nature of healthcare IT security work, circumstances are often problematic when organizations find themselves needing interim CISO leadership. Our team has the CISO experience you need with a history of turning around the security programs of multi-billion dollar healthcare organizations quickly and efficiently.

Operations Security

The devil is in the details when it comes to operations of an effective healthcare security program. Clinicians won't tolerate a security program that impacts their workflow, yet the business requires protection from the risk of intrusion and breach. Focusing on the details of operational security allows both sides to benefit. A best-in-class healthcare security program can support a clinician's workflow while still providing protection the business requires.

Data Protection

Keeping the bad guys out and the PHI in, while minimizing impact to business operations, is the Axixe approach to Data Protection and Perimeter Security. If you're like most healthcare organizations, you have a sense of where your PHI and critical business data is stored, but no assurance that this data cannot be maliciously or inadvertently transferred outside of your control. Focusing on internal perimeters around your data, as well as an external perimeter around your network, creates a layered security approach to protecting what is most important – your patient's privacy.

Security Technology Evaluation

When it comes to vulnerability analysis, intrusion detection, email security, firewalls, anti-virus and similar technologies, there are clear leaders and niche players that make sense depending on your unique needs. Our vendor-agnostic technology experts are here to help align your business requirements with the most appropriate, cost effective, solution.

Access Administration Optimization

The maturity of the process by which a healthcare organization provisions and controls access to applications and data for new clinicians, staff, and contractors is a strong indicator of the overall sophistication of the organization's security program. We provide a repeatable process for clinical application access and control to restricted data, taking your program to the next level and satisfying audit requirements along the way.
